Ebuka

My contribution to this assignment focused on completing the model training and evaluation code and answering the knowledge-check questions. I used passenger age and class to train a linear regression model for fare prediction, then used age, class, and sex to build a logistic regression model for survival prediction. I included code to make predictions and evaluate each model using the appropriate metric. I also printed the linear regression coefficients and explained what they represent. I was also responsible for combining work products. Through these tasks, I contributed to the notebook's implementation and demonstrated my understanding of the differences between regression and classification.

Cersidy

My contribution focused on training and evaluating machine learning models for both regression and classification problems. I applied Linear Regression to predict continuous numerical values and Logistic Regression to handle classification tasks by predicting categorical outcomes. Through this process, I gained hands-on experience in selecting appropriate evaluation metrics, training models, and evaluating their performance. This module strengthened my understanding of supervised machine learning and helped me appreciate how different algorithms are applied to solve real-world prediction problems.
