Ebuka
This lab helped me understand the difference between regression and classification through practical examples. Linear regression predicted passenger fares, while logistic regression predicted whether passengers survived. I learned how to prepare data, separate it into training and testing sets, train models, and evaluate predictions. I also learned that the evaluation method depends on the task, while accuracy measures how often a predicted category is correct. Overall, this assignment helped me connect the concepts of supervised learning to the Python code used to build models.

Cersidy

This module was a insightful hands-on experience that deepened my understanding of supervised machine learning. Working with Linear and Logistic Regression helped me understand how different algorithms solve prediction and classification problems. My biggest takeaway was learning the importance of choosing the right model and evaluating its performance. Overall, this module strengthened my practical machine learning skills and boosted my confidence in building and evaluating predictive models.
